

AMENDMENT TO THE SPECIFICATION

Please replace the paragraph on lines 6-14 of page 3 of the instant specification with the amended paragraph below:

According to the present invention, an improved strain relief clamp for a connector mounted on a cable includes a transparent portion such as a rectangular window or a transparent ring held in a groove groove. The cable, which is provided with unambiguous identification markings at its end region, is cut to length so that an identification marking of interest appears directly behind the connector's shell when the connector is mounted on the cable. When the strain relief clamp is installed on the connector, the identification marking of interest is visible through the transparent portion of the strain relief clamp.
